Amplitude Modulation (Simulation experiment) (Procedure)---

In amplitude modulation (AM), the message signal is impressed on the amplitude of the carrier signal. This results in a signal whose amplitude is a function of the message signal. Forms of AM: AM signals may be of various types such as . 1. Conventional double sideband AM (DSB-AM) 2. Double sideband suppressed carrier AM (DSBSC-AM) 3. Single ...

Amplitude Modulation Simulation Lab Manual Using Multisim

Amplitude modulation: Modulation is a process of translating information signal from low band frequency to high band frequency that is suits the transmission medium. Information signal is usually of low frequency, so it cannot travel far. It needs a carrier signal of higher frequency for long distance destination.

Amplitude Modulation Simulation Lab Manual Using Multisim

Amplitude modulation is one of the earliest radio modulation techniques. The receivers used to listen to AM-DSB-C are perhaps the simplest receivers of any radio modulation technique; which may be why that version of amplitude modulation is still widely used today.

The Amplitude modulation receiver will be wider when compared to the FM receiver. Because, atmospheric propagation is good for amplitude modulated signals. Bandwidths limit is also big advantage for Amplitude modulation, which doesn ' t have in frequency modulation. Transmitter and receiver are simple in Amplitude modulation.

Experimental setup In this section we describe the circuits used for generation and demodulation of amplitude modulated signals. An analog multiplier IC AD633 (Analog Devices) has been used to generate the AM signal. The AD633 is a functionally complete, four-quadrant, analog multiplier.

Amplitude modulation (AM) is defined as a process in which the amplitude of the carrier wave c(t) is varied about a mean value, linearly with the base band signal m(t). An AM wave may thus be described, in its most general form, as a function of time as follows.

SSB MODULATION: In radio communications, single-sideband modulation (SSB) or single-sideband suppressed-carrier modulation (SSB-SC) is a type of modulation, used to transmit information, such as an audio signal, by radio waves.A refinement of amplitude modulation, it uses transmitter power and bandwidth more efficiently. Amplitude modulation produces an output signal the bandwidth of which is ...

In Amplitude Modulation the amplitude of carrier signal varied according to audio input signal. In order to generate AM we just need to add a DC to input signal and multiply it to carrier signal, which generates modulated waveform. In this way an envelope gets created around the carrier signal, which follows the input audio signal Figure 1
