In operation, fluid pressure $p = G \times g$ acts upon the exposed surface of the seal and activates the sealing ring so that the contact pressure increases to a higher value $G \times p$ (Fig. 2). The sealing mechanism is called automatic because this contact pressure $G \times p$ exceeds the fluid pressure to be sealed p .

Fluid sealing technology: principles and applications ...

Convection: Air flow induced by the rotating parts of a seal can move fine liquid droplets outwards through a sealing gap, especially in noncontacting seals. Equally, rotating parts can induce inward air flow, which transports dust particles or liquid droplets from the environment into the space being sealed.
